Forgotten Books, United States, 2015. Paperback. Book Condition: New. 229 x 152 mm. Language: English . Brand New Book ***** Print on Demand *****.Excerpt from Form-Factors in Coniferae During the last decades the investigation of Gymnosperms, and more particularly that of Coniferous trees, has been concerned with the detailed examination of reproductive processes and phases, as also of cytological phenomena, with a view to determining affinities by the more obscure relations of the vestigial gametophytes and sexual organs. Anatomy and timber-structure have been more intensively studied, - but the general external morphology remains very much in the state it was left at the hands of an older generation. Much can, however, still be done in the observation of the more striking characters as seen with the naked eye; there being many such features which appeal to an observer in the open, though they may be less appreciated in the laboratory. Many of the older generalizations, again, are capable of revision in the light of a broader modern outlook on the general problems of ecology and biology of the vegetable kingdom as a whole. Such broader features of growth-form cover a wide range of morphological adaptations as representing solutions of special biological problems, of a significance quite as important in the everyday life of the organism as the more minute mechanism of cell-anatomy, or of racial continuation, and may be equally archaic and vestigial in some respects, as presenting the progression of a unique and disappearing race of tree-forms. Somatic Organization, including specialization of the space-form of the plant, and its adaptation to subserve different functions, involves the successful utilization of a few simple general factors of the relation of stem (axis) and leaf (appendage or member). This conventional standpoint is very generally accepted as a postulate for the study...
